

PANTHER

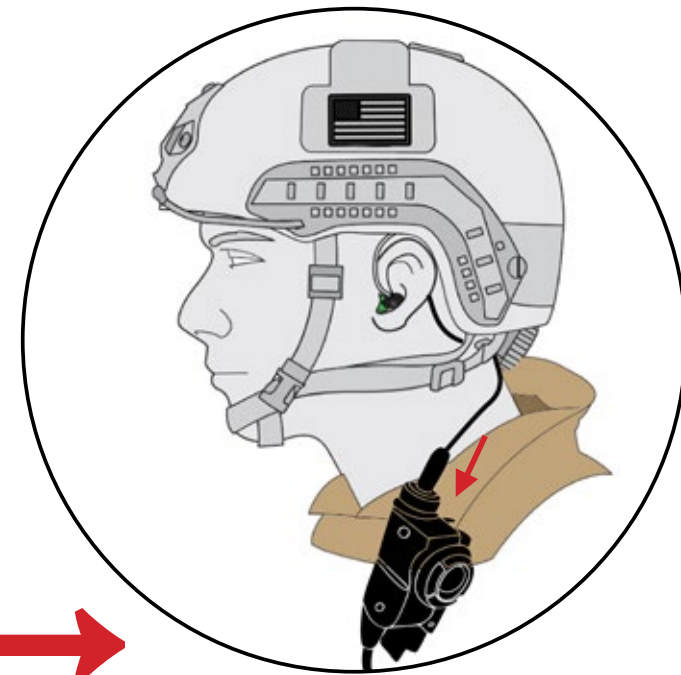

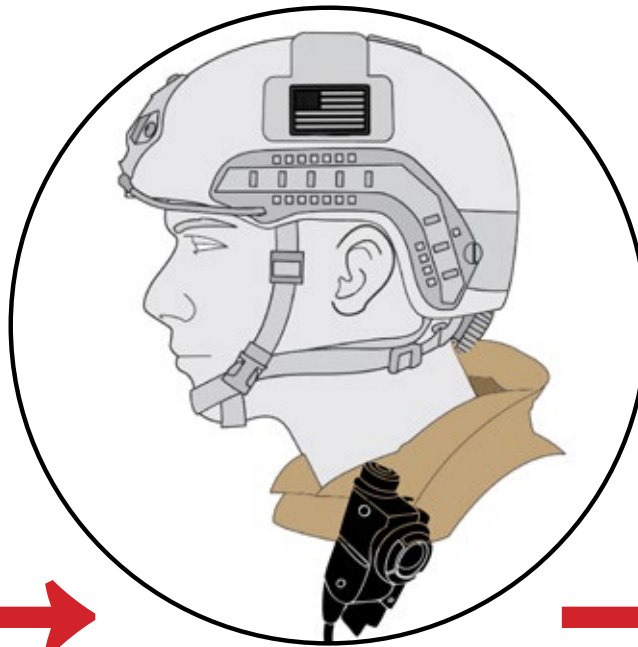

APPLICATION NOTES

Panther was uniquely developed to provide operators a simple means to transition to an in-the-ear (intra aural) headset to reduce neck fatigue and discomfort related to circumaural headsets. Panther enables this transition without having to replace existing push-to-talk and cable routing system. Panther headset—weighing only 4 grams—is designed to simply “plug-and-play” into the innumerable push-to-talk systems fielded today.

By effortlessly unplugging an existing circumaural headset from the installed push-to-talk (PTT) unit and plugging the Panther into that same PTT, the operator can transition from one headset to the other in literally seconds. No adaptors or other hardware is required.
